

private key is
inside the device, so that no other
device can intercept it
during the transaction.
the only thing that comes out of the
data connection is the encrypted message.
the other side of the terminal is allowed
to provide a message for the device
to encrypt.

the meaning of the three lights:

red - power on
(should turn on when you plug it in
and off when you unplug)

orange - received data to encrypt, need
button press to authenticate

green - button pressed, message
has been encrypted and transmitted

device will be round and sexy
but i am not good at sketching
